MAX77504 WLP Evaluation Kit

Evaluates: MAX77504 (MAX77504AAWE+/MAX77504BAWE+)

General Description

The MAX77504 evaluation kit (EV kit) provides a proven design to evaluate the MAX77504, a 3A high-efficiency buck converter. The IC is capable of 2.6V to 14V input and is output voltage configurable between 0.6V to 6V. The factory default output voltage of this EV kit is set at 3.3V. Output voltage can be configured by changing the feedback resistor values (R3 and R4). Two GPIO pins are available to support Force PWM and EN function.

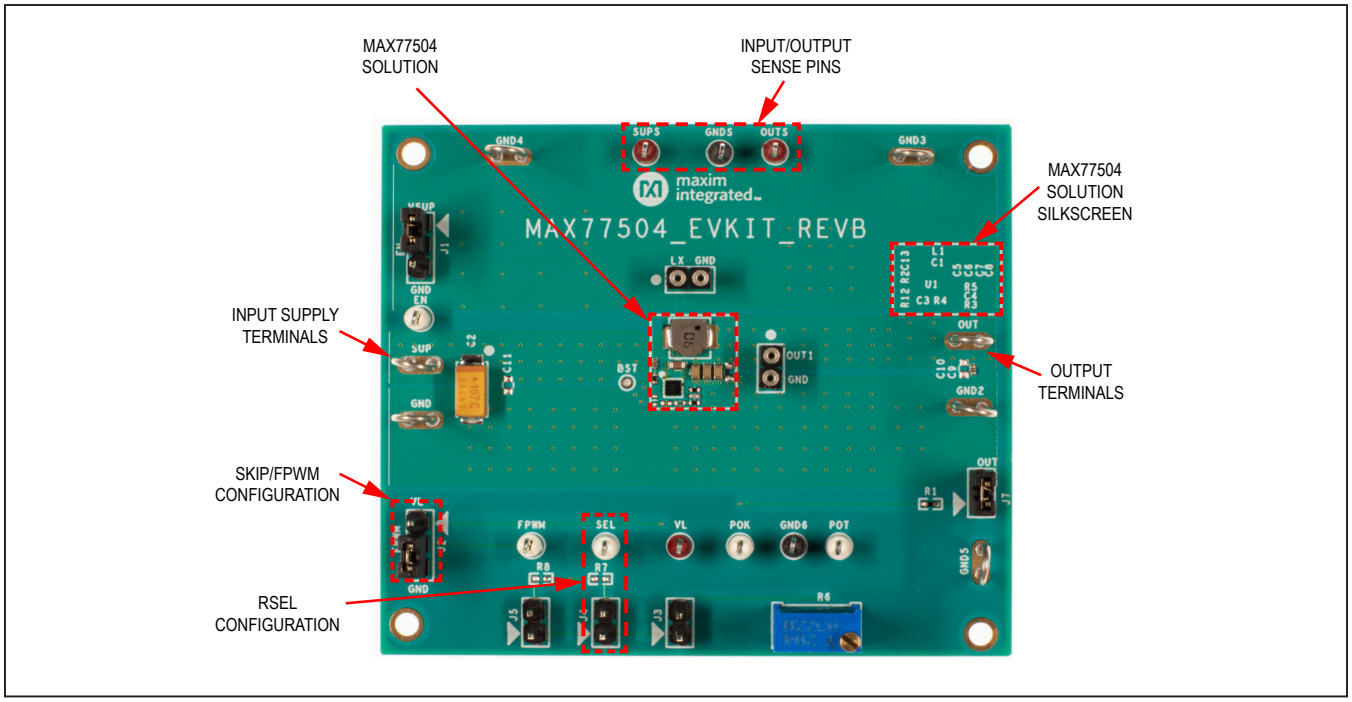
Features and Default Settings

- Sense Points for High-Accuracy Measurements
- Accessible Test Points for EN, POK, FPWM, and OUTS
- Switching Frequency Configurable Between 500kHz to 1.5MHz Through SEL
- FPWM and Skip Mode Configurable (Skip Mode Default)
- UVLO Rising = 2.6V, UVLO Falling = 2.4V

***Ordering Information* appears at end of data sheet.**

SPECIFICATION	TEST CONDITIONS	MIN	TYP	MAX	UNIT
Input Voltage		2.6		14	V
Output Voltage		0.6		6	V
Default Output Voltage	R3 = 49.9kΩ, R4 = 11.1kΩ		3.3		V
Output Current		0		3	A
Peak Efficiency	$3.7V_{IN}$, $3.3V_{OUT}$, 300mA load			97.6	%

MAX77504 Evaluation Board



maxim integrated™

Quick Start

Required Equipment

- MAX77504 EV kit
- Adjustable DC power supply with 14V and 3A capability
- Digital Multimeters

Procedure

The EV kit is fully assembled and tested. Follow the steps below to verify board operation. Use twisted wires of appropriate gauge (20AWG) that are as short as possible to connect the load and power sources.

1) Ensure that the EV kit has the correct jumper settings, as shown in Table 1.
2) Connect a DVM to the SUPS and GNDS sense pins to measure input voltage.
3) Connect a DVM to the OUTS and GNDS sense pins to measure output voltage.
4) Apply a power supply set to 0V (100mA current limit) across the VIN and PGND terminals of the EV kit. Turn the supply on and increase the voltage to 12V.
5) Confirm the DVM connected to OUTS and GNDS reads the default output voltage of the EV kit (3.3V).

Description of Hardware

The MAX77504 EV kit demonstrates the MAX77504 buck converter. It regulates output from input voltage ranges from 2.6V to 14V. Configurable output range is from 0.6V to 6.0V with feedback resistors R3 and R4. The EV kit is suited with a general DC input. Table 1 lists jumpers and associated functions that are available on the EV kit.

Design Procedure (Choosing RSEL)

The MAX77504 includes an RSEL pin to configure the switching frequency, mid-band gain, and active discharge on startup. The configuration selection resistor (RSEL) sets five bits of configuration options decoded in Table 2. Choose RSEL[4:0] carefully by following the procedure outlined in the *Design Procedure* section of the IC data sheet; or refer to the *Typical Application Circuits* section of the IC data sheet for a list of known good RSEL choices for common applications. Resistors with tolerance 1% (or better) should be chosen for R7, with nominal values specified in Table 3. Ensure proper resistor configuration by measuring the resistance across SEL and GND sense points.

Table 1. Default Shunt Positions and Jumper Descriptions

JUMPER	NODE OR FUNCTION	SHUNT POSITION	FUNCTION
J1	EN	1-2*	Connects EN to V_{IN} (MAX77504 is enabled by default).
		2-3	Connects EN to GND.
J2	FPWM	1-2	Enables FPWM function.
		2-3*	Enables SKIP mode function.
J3	RSEL	1-2	Potentiometer (R6) value configuration to set switching frequency, mid-band gain, and active discharge (Default RSEL = OPEN).
J4	RSEL	1-2	Resistor (R7) value configuration to set switching frequency, mid-band gain, and active discharge (Default RSEL = OPEN).
J5	RSEL	1-2	Resistor (R8) value configuration to set switching frequency, mid-band gain, and active discharge (Default RSEL = OPEN).
J7	POK	1-2*	Enables Power-OK indicator function.

** Default position*

For example, choose a 30.9kΩ (1% TOL) resistor to program RSEL[4:0] to 0x16. 0x16 (0b10110) decodes with the following configuration:

- FSW[1:0] = 0b10 (1MHz switching frequency)
- GAIN[1:0] = 0b11 (200kΩ R_{COMP})
- ADEN = 0b0 (active discharge disabled)

Table 3 indicates that a 30.9kΩ selection resistor selects code 0b10110 (0x16). The device evaluates R_{SEL} whenever SUP is valid and EN transitions from logic 0 to 1. The decoded value of R_{SEL} is latched until the next EN rising edge.

Table 2. MAX77504 RSEL Configuration Bits

RSEL[4:0]		NAME	DESCRIPTION	DECODE
MSB	Bit 4	FSW[1:0]	Switching Frequency Control. Sets F_{SW}.	00 = 0.5MHz 01 = 0.75MHz 10 = 1.0MHz 11 = 1.5MHz
	Bit 3			
	Bit 2	GAIN[1:0]	Mid-band gain control. Sets R_{COMP}.	00 = 75kΩ 01 = 100kΩ 10 = 150kΩ 11 = 200kΩ
	Bit 1			
LSB	Bit 0	ADEN	Active discharge resistor enable.	0 = disabled 1 = enabled
Program these bits by choosing a configuration selection resistor (R_{SEL}) with a tolerance of 1% or better using lookup Table 3.				

Table 3. Configuration Selection Resistor (RSEL) Lookup Table

R_{SEL} (Ω) → RSEL[4:0]		
95.3Ω or SHORT → 0x00	1620Ω → 0x0B	30900Ω → 0x16
200Ω → 0x01	1870Ω → 0x0C	36500Ω → 0x17
